I. Introduction

Subprime mortgage lending¹ has grown rapidly in recent years² and with it, so have concerns about predatory lending.³ According to data from the Mortgage Bankers Association, for the year ending September 30, 2006, delinquencies rose 16.7 percent for subprime loans generally and 25.3 percent for subprime adjustable-rate mortgages.⁴ State and federal authorities have successfully prosecuted numerous mortgage lenders and brokers for alleged subprime lending abuses.⁵

Subprime loans expand credit to borrowers who were historically excluded from the credit markets. At the same time, harm from abusive subprime lending reduces the welfare benefits otherwise associated with increased availability to credit. Since the enactment of the federal Home Ownership Equity Protection Act (HOEPA) in 1994, a growing number of states have enacted mini-HOEPA statutes to counteract predatory lending. Other states have laws that regulate a more limited set of lending practices associated with predatory lending, such as prepayment penalties. Today, well over half the states have anti-predatory lending statutes of one kind or another.⁶

The effect of these statutes is a matter of debate. Critics charge that anti-predatory lending statutes reduce the availability of credit to borrowers who previously were credit-constrained, including lower-income households and people of color, by rationing credit and increasing the price of subprime loans. Supporters of these statutes argue that regulation is needed, both to allay consumer fears about dishonest lenders and to ensure that creditors internalize the cost of any negative externalities resulting from predatory loans.⁷

The great variety of approaches by individual states to regulating lending -- in terms of the loans they cover, the restrictions they impose, and the enforcement mechanisms they establish -- permits the testing of the influence of various approaches on the flow and cost of credit. Prior studies of the impact of these laws have yielded mixed results; however, because of shortcomings in these studies, there are questions about the accuracy of their findings and the generalizations that can be drawn from them. This paper seeks to address some of the weaknesses in these earlier studies in order to produce sharper results that improve the understanding of this increasingly important issue. In particular, this study considers a broader set of statutes than prior research, which allows for a more comprehensive, and more accurate, characterization of the legal environment. Moreover, this study takes into account enforcement mechanisms of anti-predatory lending laws that have not previously been examined in any detail, and thus broadens and deepens our understanding of the effects of government enforcement, private rights of action, and assignee liability provisions.

The results of the analysis suggest that stronger state laws increase the odds of originating a subprime loan by 3 percent, reduce the odds that a subprime loan application will be rejected by 3 percent, and have no discernable effect on the probability of a subprime application. Increasing a state law's coverage -- *i.e.*, the range of loans covered by the law -- increases the odds of subprime origination and applications and lowers the odds of subprime loan rejections. In contrast, increasing the legal

restrictions in a state law reduces the likelihood of subprime origination and applications and has no effect on subprime loan rejections. Finally, stronger legal enforcement mechanisms raise the odds of subprime origination and applications and reduce the odds of rejection.

This paper unfolds as follows. Part II provides a brief history of anti-predatory lending laws applying to residential mortgages. Part III reviews the empirical studies to date on the effect of state and local anti-predatory lending laws on residential mortgage credit. Part IV describes the dataset and the design of the study, and sets forth the results. Part V concludes.

II. A Brief Sketch Of Anti-Predatory Lending Laws

Since ancient Babylonia, governments have sought to regulate abusive loans. In the United States, states have regulated interest rates on loans since the signing of the Constitution.⁸

Anti-predatory lending laws differ from traditional usury laws by focusing on practices and loan terms beyond interest rates. While many view state anti-predatory lending laws as a recent development, some states have been regulating non-interest loan terms such as prepayment penalties and balloon clauses in order to prevent abuses for decades. In some states, these restrictions are found in state usury statutes; in other states, they are found in local versions of the Uniform Consumer Commercial Code.⁹ Among the older state laws, Alaska, Connecticut, Hawaii, Idaho, Indiana, Iowa, Kentucky, Michigan, Mississippi, Missouri, Rhode Island, South Carolina, Utah, and Wyoming have individual restrictions on prepayment penalties; Maine restricts balloon clauses; and Alabama and Maryland have restrictions on both.

In the late 1980s and early 1990s, the emergence of subprime mortgage lending and concerns about associated abuses prompted some states to pass statutes aimed at curtailing certain abusive loan terms. In 1994, the U.S. Congress enacted the first modern, comprehensive anti-predatory lending statute, the Home Ownership Equity Protection Act (HOEPA). HOEPA regulates only the costliest subprime loans, termed “high-cost loans,” which are defined as loans exceeding one of the following two triggers:

- where the annual percentage rate (APR) at consummation exceeds the yield on Treasury securities of comparable maturity plus eight percent for first-lien loans or ten percent for subordinate-lien loans; or
- where the total points and fees exceed eight percent of the total loan amount or \$400 (subject to annual indexing), whichever is greater.¹⁰

HOEPA covers no more than five percent of subprime residential mortgages and likely less.¹¹ For that narrow set of loans, HOEPA imposes a number of substantive restrictions on lending terms or practices, including limitations on balloon terms, negative amortization, advance payments, increased interest after default, rebates, prepayment

penalties, due-on-demand clauses, payments to home improvement contractors, loans made without regard to ability to repay, and loan flipping.¹² Lenders must also make specialized, advance disclosures to borrowers receiving HOEPA loans. HOEPA imposes liability for violations on lenders and assignees of HOEPA loans.¹³

In the late 1990s, many states began adopting legislation to redress predatory lending. Some of these state laws are patterned on older laws that pre-dated HOEPA. For example, new laws enacted by Colorado, Louisiana, Michigan, Nebraska, Vermont, and Virginia restricted prepayment penalties or balloon payments on some loans (Nebraska not terribly effectively) with low triggers or none at all. Vermont, Michigan, and Tennessee adopted new disclosure statutes. Virginia's law also addressed loan flipping. Other states, including New York and Massachusetts, initially addressed predatory lending through banking department regulations that authorized agency sanctions but not private lawsuits by aggrieved borrowers. Mississippi banned asset-based loans and capped fees to mortgage brokers. Kansas instituted additional loan restrictions, only some of which were subject to triggers, and indexed the triggers to interest rates on conventional mortgages, rather than on Treasury securities. Numerous states also adopted mortgage broker and banker licensing and regulation laws.

Starting in 1999, states began taking a different tack by enacting statutes patterned directly on HOEPA. North Carolina, the first state to adopt a true state "mini-HOEPA" law, passed its statute in 1999. The North Carolina statute took effect in two stages, with most restrictions becoming effective at stage 2. The statute is described in **Table A**. Essentially, North Carolina used the same HOEPA APR trigger but a lower points and fee trigger and expanded HOEPA's substantive protections. In short order, the North Carolina's mini-HOEPA law inspired other states to enact mini-HOEPA laws of their own, which generally operate in addition to the other state laws mentioned above. As of January 1, 2007, twenty-eight states and the District of Columbia had mini-HOEPA statutes in effect (**Table B**).

The state mini-HOEPA laws display considerable variation. With respect to coverage, some states, such as Connecticut, Florida, Kentucky, and Nevada, use the same numerical triggers as HOEPA. Most state mini-HOEPA laws, however, lower one or both of the HOEPA triggers. Restrictions also vary widely among the states, with some states imposing scant restrictions and others imposing heavier ones. Finally, the enforcement provisions in state mini-HOEPA laws are all over the lot. Some laws only provide for government enforcement, while others afford injured borrowers the right to sue. Some laws authorize assignee liability, while others restrict private lawsuits to loan originators and assignees who do not qualify as holders-in-due course. Some laws authorize double or treble damages; others cap monetary relief in private lawsuits to compensatory damages only.¹⁴

Many of the states that adopted mini-HOEPA laws layered them on top of older restrictions on predatory lending that are still in effect. Eleven states augmented their old prepayment penalty laws with new mini-HOEPA laws; two more states grafted their mini-HOEPA laws onto older laws regulating other loan practices. Maryland's version of the layer-cake phenomenon is the most complex: its mini-HOEPA law stands side-by-

side with five older Maryland anti-predatory lending provisions. In all of these cases, the new mini-HOEPA statutes supplement, rather than supplant, the older state laws.

In sum, by January 1, 2007, only seven states – Arizona, Delaware, Montana, North Dakota, Oregon, South Dakota and the State of Washington -- had no mini-HOEPA statutes or other laws or regulations in effect restricting prepayment penalties, balloon clauses, or mandatory arbitration clauses in residential mortgages.

Federal law has preempted portions of these state laws at various times for certain types of lenders and loan products. The federal Alternative Mortgage Transactions Parity Act (AMTPA) preempts balloon clause restrictions for all mortgages by non-depository lenders except for traditional fixed-rate, fully amortizing mortgages. AMTPA applies to all states except states that opted out of its restrictions.¹⁵ The Home Owners' Loan Act preempts state anti-predatory lending laws for federal savings associations and their subsidiaries.¹⁶ Finally, effective February 12, 2004, the U.S. Office of the Comptroller of the Currency (O.C.C.) preempted state anti-predatory lending laws for national banks and their operating subsidiaries.¹⁷ Some states, such as Georgia, also have state "wild card" laws that waive their anti-predatory lending laws for state-chartered banks and thrifts and their subsidiaries to the same extent that federal preemption shields national banks and federal thrifts from those state laws.¹⁸

Federal preemption is highly contested and its scope is in flux. In November 2005, the U.S. Supreme Court heard arguments challenging the O.C.C. preemption rule as unconstitutional and the case awaits decision.¹⁹ Congress is likely to consider the scope of federal preemption in hearings on proposed new federal anti-predatory legislation in 2007.

III. Literature Review

Although some states have regulated practices associated with predatory lending for decades, until recently there were no studies evaluating the effects of state and local anti-predatory lending laws (other than caps on interest rates) on credit flows and loan prices. That changed with the passage of North Carolina's anti-predatory lending law in 1999. Since then, a number of studies have examined the effect of state mini-HOEPA laws on an assortment of outcomes. Many of these studies consist of event studies of one jurisdiction's law; others analyze outcomes nationally.

A. Event Studies Of Individual State Or Local Laws

1. The North Carolina Law

The first studies looking at state and local anti-predatory lending laws consisted of event studies of the North Carolina law. Most of these studies examined the law's effect on the flow of credit. All agreed that subprime originations fell disproportionately in North Carolina after passage of the law, but there is sharp disagreement as to why. Other studies examined whether the dip in subprime loans in North Carolina after passage of its anti-predatory lending law was due to a reduction in supply or in demand. Finally, a pair

of studies analyzed whether the North Carolina law targeted predatory loan terms without impairing legitimate credit.

Early studies of the North Carolina law used simple statistics to draw inferences. Ernst, Farris and Stein (2002) used Home Mortgage Disclosure Act (HMDA) data to compare subprime lending in North Carolina in 1999 and 2000 with subprime lending in the rest of the country. The authors found that total subprime originations fell in North Carolina in 2000, compared with other states. The study reported, however, that North Carolina had 15 percent more subprime home loans per capita than the national average in 2000 and that lower-income borrowers in North Carolina received a higher proportion of subprime to prime loans in 2000 than lower-income borrowers in any other state.

Another study focused on credit flows by surveying the rate sheets of several large subprime lenders who were active in North Carolina after enactment of the law (Inside B&C Lending, 2001). The researchers found that the lenders still offered a full menu of loan products with little or no effect on loan prices.

Elliehausen and Staten (2004) conducted a multivariate regression study to compare the volume of subprime mortgage originations in North Carolina with that in South Carolina, Tennessee, and Virginia before and after passage of the North Carolina law. The authors used a proprietary dataset with data on all closed-end subprime residential mortgages originated between June 1, 1997 and June 30, 2000 by nine major lenders who belonged to the American Financial Services Association.²⁰ Although the dataset had loan-level credit (FICO) scores, the regression analysis did not use that data. Instead, the study controlled for borrower characteristics at the county level (including income, debt burdens, average house values, age cohorts, and length of delinquencies), plus the price of debt and passage of the North Carolina law. The study found that the volume of subprime mortgages originated in North Carolina counties dropped about 14 percent, relative to other counties in the control states, after passage of the state law. In relative terms post-law, subprime originations dropped for North Carolina borrowers with annual household incomes of \$50,000 or less, but rose for higher-income borrowers in that state.

There are several substantive issues with the Elliehausen and Staten study. First, a small number of lenders were surveyed. Second, the time-period examined ended before the law went fully into effect.²¹ Third, the model assumed that the control states had no anti-predatory lending provisions in effect. During all or part of the time-period studied, however, one of the control states – South Carolina – had a partial ban on prepayment penalties in residential mortgages and another control state – Virginia – had an anti-loan flipping provision in effect.²² In addition, during the same period, AMTPA preempted at least two of the North Carolina provisions that did go into effect during the time-period studied – the ban on balloon clauses in closed-end home loans and on prepayment penalties in personal home loans under \$150,000 – in all mortgages by non-depository lenders except for traditional fixed-rate, fully amortizing mortgages.²³ Thus, South Carolina was arguably *more* restrictive than North Carolina with respect to prepayment penalties during the time-period studied and Virginia, like North Carolina, had provisions in effect on loan flipping.

Two other studies looked at whether the reduction in North Carolina subprime loans post-law was due to supply-side or demand-side effects. A report by Burnett, Finkel and Kaul (2004), which used HMDA data and cross-tabulations, found that loan originations fell in North Carolina relative to South Carolina and Tennessee after passage of the law. The North Carolina decline was due to relative drops in application volumes; denial rates were lower in North Carolina than in the control states post-law.²⁴

Similarly, using multivariate regression, Harvey and Nigro (2004) analyzed HMDA data before and after passage of the North Carolina law in July 1999 to determine the law's effect on home mortgage applications, originations, and denials. Georgia, South Carolina, Tennessee, and Virginia served as the control states. The authors treated all residential mortgage applications processed by lenders on the annual subprime lender list compiled by the Department of Housing and Urban Development (HUD) through 2000 as subprime loan applications.²⁵

Harvey and Nigro found that the probability of subprime loan applications and originations fell in North Carolina post-passage, but the probability of subprime loan denials did not, relative to the control states. Thus, they attributed the falloff in North Carolina originations to reduced demand, not supply. Contrary to Elliehausen and Staten, they reported that the law had no differential effect on North Carolina borrowers with household incomes of \$25,000 or less. Similarly, subprime lending by bank lenders held steady in North Carolina following adoption of the law, while subprime lending by nonbank lenders fell there, in comparison with the control states. Finally, the market share of subprime loans fell in North Carolina after passage, compared with the control states. Similar to the Elliehausen-Staten study, the Harvey-Nigro study stopped before the North Carolina law took full effect, assumed that the control states did not regulate predatory lending in any way, and did not account for AMTPA preemption of parts of the North Carolina law.

A last group of studies examined whether the North Carolina law had struck a balance between curtailing abusive loans and ensuring the availability of credit to subprime borrowers. Ernst, Farris and Stein (2002) estimated that the North Carolina law saved North Carolina borrowers \$100 million by deterring predatory loan practices. Quercia, Stegman and Davis (2004) refined this analysis by using cross-tabulations on loan-level data to determine whether the North Carolina law was well-tailored. Their study used loan-level Loan Performance data on over 3 million securitized subprime loans originated from 1998 through the first quarter of 2002. The database had data on FICO scores, prepayment penalties, balloon clauses, and loan-to-value ratios, but not on borrower income, race, or ethnicity. The study improved upon its predecessors by comparing subprime lending patterns before initial implementation of the North Carolina law on October 1, 1999 and after full implementation on July 1, 2000. As did most of the other studies, Quercia et al. assumed that none of the southern control states had anti-predatory lending measures in place.

The authors confirmed that overall subprime originations dropped in North Carolina following enactment, while subprime originations elsewhere increased. They found, however, that the North Carolina falloff was confined to the refinance market, where loan

flipping abuses can occur. In contrast, subprime home purchase originations in that state grew as fast as or faster than in some nearby states and the U.S. generally. Almost ninety percent of the reduction in subprime mortgages in North Carolina post-law consisted of subprime loans with at least one predatory feature.²⁶ In the opinion of the authors, “the NC Act [was] doing what it [was] supposed to do.”²⁷

2. Other Studies Of Local Jurisdictions

Two event studies considered the effect of state or local anti-predatory lending laws in jurisdictions other than North Carolina. Harvey (2003) studied HMDA data to ascertain the effect of anti-predatory lending ordinances adopted by Chicago and Philadelphia on subprime originations, applications, and denials. The Philadelphia ordinance was a local mini-HOEPA law; in contrast, the Chicago law barred the city from doing business with depositories or contractors who made high-cost loans that contained predatory terms. For Chicago, multivariate regression analysis showed that the likelihood of subprime loan denials and of nonbank originations of prime loans was no different in Chicago post-law than in the rest of Illinois. In contrast, after enactment of the ordinance, the likelihood of subprime originations generally and by nonbanks in particular was greater in Chicago than in the rest of Illinois. Among other things, this suggests that subprime lending migrated from banks to nonbanks after passage of the law. No conclusions can be drawn from the Philadelphia results because the study did not examine data during the brief time-period when the Philadelphia ordinance was in effect.²⁸

In an industry-commissioned study of the New Jersey law, DeMong (2004) surveyed 14 subprime lenders and 84 mortgage brokers in New Jersey. The respondents said that the dollar volume of subprime cash-out refinance loans unique to New Jersey dropped 57.7 percent between the two months immediately preceding the New Jersey law’s implementation and the two months immediately afterward. Over the same time period, the respondents said that the dollar volume of subprime home improvement loans unique to New Jersey dropped 73.2 percent. The survey did not examine actual loan-level data or control for borrower characteristics or macroeconomic factors.²⁹

B. Nationwide Studies Of State Anti-Predatory Lending Laws

With the growth in state mini-HOEPA laws, more recent studies have examined the effects of the state and local laws on a national scope. An early study by Morgan Stanley (2002), for example, surveyed subprime branch managers and mortgage brokers across the country. The investment bank reported that growth forecasts by respondents in “tough” states were not significantly different from growth forecasts by respondents in “easy” states. The report observed, “One of the consistent messages we heard from our respondents was that the increased level of disclosures was boosting consumer comfort levels with subprime products and thus providing a positive impact on loan volume.”³⁰

Li and Ernst (2006) used the Loan Performance database of subprime securitized loans to analyze the effect of state laws from January 1998 through December 2004. The study ranked state laws according to the type of loans covered, points-and-fee triggers,

substantive legal protections, and remedies available to borrowers. The authors concluded that state anti-predatory lending laws reduced the prevalence of predatory loan terms, without reducing subprime loan originations (except in Georgia and New Jersey),³¹ compared with unregulated states. In addition, nominal interest rates on mortgages stayed level or dropped in all states with anti-predatory lending laws except Georgia and Virginia,³² compared with the controls.

Using HMDA data, Ho and Pennington-Cross (2006b) constructed a legal index to examine the effect of state anti-predatory lending laws on the probability of subprime applications, originations, and rejections. They focused on border counties of adjacent states with and without anti-predatory lending laws, rather than entire states, to help hold labor and housing markets constant.³³ Having a state anti-predatory lending law had no effect on the probability of origination and only a scant negative effect on the probability of applications, while it reduced the likelihood of being rejected. Stronger restrictions reduced the likelihood of origination and applications, but had no effect on the likelihood of rejection. Conversely, stronger coverage increased the likelihood of origination and applications without affecting the likelihood of rejection, suggesting that anti-predatory lending laws with lower triggers boost demand by reducing consumer fears about abusive lenders.

Ho and Pennington-Cross (2006a) used the same legal index and border area methodology to examine the effect of state anti-predatory lending laws on the cost of credit. Using HMDA data from 2004, they discovered that subprime loans originated in locations with anti-predatory lending laws had lower APRs than loans in unregulated states. They also found that increasing the strength of a law had the same effect. In both cases, greater coverage rather than stronger loan restrictions explained the lower APRs in regulated states. A comparable analysis using Loan Performance data from 1998 through 2005 yielded somewhat different results. State anti-predatory lending laws modestly increased nominal interest rates on fixed-rate loans, but lowered them on adjustable-rate loans. For both types of loans, laws with more restrictions displayed the same or higher spreads, while laws with greater coverage displayed lower spreads.

A national study by Elliehausen, Staten and Steinbuks (2006) used a proprietary database of subprime loans originated by eight large lenders from 1999 through 2004, covering about 22 percent of high-priced residential mortgages. The dataset contained loan-level information on APRs and points and fees, which helped the authors to distinguish loans covered by state mini-HOEPA laws from loans that were not. Approximately 80 to 90 percent of the mortgages in the database were refinance loans.

The study used three approaches to examine the effect of state laws on subprime originations. In the first approach, the authors modeled the presence or absence of a state law as a binary variable and found that the presence of a law was associated with a decrease in total subprime mortgages, including both the high-cost and non-high-cost variety. The second approach ran the same analysis with the combined legal index developed by Ho and Pennington-Cross and reached the same result. The third approach consisted of an event study that used pre-law observations to predict the number of expected subprime originations for the post-law period. The state-by-state results were

randomly distributed. About half of the states with strong laws (by our estimation)³⁴ had higher-than-expected originations and about half of those states had weaker-than-expected originations. For the vast majority of laws with high combined scores for coverage and restrictions, high-cost originations fell while non-high-cost subprime originations remained the same or grew. The authors interpreted these findings as evidence that lenders shifted lending from covered high-cost loans to uncovered loans in response to the enactment of state mini-HOEPA statutes. It is not clear from the study, however, what role coverage played versus restrictions. Similarly, it is not clear whether any decrease in originations was due to a reduction in demand, in supply, or in both.

IV. Taking A Deeper Dive: Our Study Of The Impact Of State Anti-Predatory Lending Laws

This study builds on the prior literature by conducting a national examination of the impact of all anti-predatory lending laws, not just mini-HOEPA laws, on subprime mortgage markets. Following Harvey and Nigro (2004) and Ho and Pennington-Cross (2006), and given our interest in the effects of these laws on both applicants and lenders, we focus on three outcomes – (1) the probability of applying for a subprime loan relative to a prime loan, (2) the probability of originating a subprime loan relative to a prime loan, and (3) the probability of a subprime application being rejected. We relate these outcomes to various borrower and locational characteristics as well as to the anti-predatory law environment in which the borrower and lender made their decisions.

Our study distinguishes itself from its predecessors in several respects. Most significantly, it reflects a new and more comprehensive canvassing of primary legal sources to paint a complete picture of the landscape regarding anti-predatory lending laws. This new collection effort has highlighted 15 additional states that have anti-predatory lending laws that were not identified as such using the standard approaches for identifying such laws.³⁵ Thus our study considers 40 states while others would include only 25.

Second, this new collection effort has resulted in a dataset that permits an examination of the effects of various enforcement mechanisms established by the laws, which was previously not possible. We therefore were able to assess whether legal enforcement mechanisms matter for individual and lender behavior. Among other things, the new data allow us to control for the presence and strength of assignee liability provisions in state and local anti-predatory lending laws, which is critical because over eighty percent of subprime home mortgages are securitized today.³⁶

In other respects, this research builds upon prior studies. Like other projects, we use HMDA data, which provides the broadest coverage and enables us to examine most residential mortgage lending nationwide. The advent of HMDA pricing data in 2004 permits us to distinguish prime from subprime loans with greater accuracy than studies using HMDA data for years before 2004. We thus limit our focus to 2004 and 2005 to capitalize on this enhanced measure.

We use two methods to identify subprime loans. First, as in the prior literature, we use a list of subprime lenders generated by HUD through industry trade publications, HMDA data analysis, and phone calls to confirm the extent of subprime lending.³⁷ Second, we define loans reported by HMDA as having an APR/comparable Treasury yield spread of 3 percentage points (300 basis points) or higher as being subprime loans. Unfortunately, the spread is only reported on originated loans so we cannot directly examine the demand for loans through the application function. For observations in 2004, all empirical tests are repeated using either the HUD list definition for subprime loans (denoted as “List” in the tables) or the HMDA pricing rule to define subprime loans (denoted as “Price” in the tables). For loans originated in 2005, the HUD list is not yet available, so we report results only for originations, using the HMDA pricing rule alone.

While we model the presence of a law as a binary variable, as do other studies, we also consider how the strength, coverage, and enforcement mechanisms of state anti-predatory lending laws influence market outcomes. In addition, because the treatment of effective dates has been an issue in earlier studies, we establish an explicit approach that excludes any jurisdiction whose mortgage lending laws changed in any material respect during the calendar year. Finally, we control for borrower and location characteristics such as unemployment rates, housing vacancies, population growth, and income.

The following subsections provide more detail regarding our empirical work. Because of its importance for the current study, the data collection effort and the creation of our new index for state-level anti-predatory lending laws is discussed in detail below. We then discuss the identification strategy for determining the effect of anti-predatory lending laws. Following this is a discussion of the empirical model and then the empirical results.

A. Description Of The Data

1. Legal Dataset And Index

We created a legal index that refines and builds on an index previously created by Ho and Pennington-Cross (2006(a)). The Ho and Pennington-Cross index coded state and municipal laws along two dimensions: coverage and restrictions, each of which contained four measures. In creating their index, Ho and Pennington-Cross relied on a chart of anti-predatory lending laws produced by a private law firm.

Like Ho and Pennington-Cross, our legal index contains four coverage and four restriction measures. Our study differs, however, in several respects. First, we analyzed the actual statutes governing lending in every state to identify anti-predatory lending provisions and did not limit ourselves to mini-HOEPA laws. As a result, we did not rely on secondary sources for information on state laws. Second, we added two new measures: assignee liability and enforcement methods against originators to the index. Lastly, because law professors conducted the statutory analysis, we were able to detect subtleties in the laws that led to a more refined index and more accurate coding of the laws. **Table C** fully describes the parameters of the index.

In measuring the breadth of a law's coverage, we take into account the types of loans that are covered by the law and any annual percentage rate (APR) and points and fee thresholds that trigger application of the law. Laws that are HOEPA-equivalents in terms of coverage are scored 0. Laws that govern all loans or that have no triggers receive the highest scores on the index.

The first measure in the coverage index is the type of loan covered by the law. Laws that apply to more loan types receive a higher score. For example, if a law does not cover Federal Housing Administration or Veteran's Administration loans, it is scored 1. In contrast, laws that apply to all types of loans receive a score of 4. The APR and points and fees measures are graduated with HOEPA serving as the floor. Thus, HOEPA equivalents are scored 0 and laws without triggers receive the highest possible scores. Those laws with triggers lower than HOEPA's are assigned intermediate scores based on where they fall relative to HOEPA.

The restrictions measure considers four features of anti-predatory lending laws: limits on prepayment penalties, restrictions on balloon payments, requirements for credit counseling or notice of the availability of such counseling, and restrictions on loan terms that limit or bar borrowers' access to the courts. As with the coverage measures, the laws that impose the most onerous restrictions receive the highest number of points on the restrictions index. A ban, for example, on prepayment penalties would code a 4 while a law that was silent on prepayment penalties would be a 0, with gradations between based on the timing of bans on prepayment penalties. A similar scale holds for limits on balloon payments.

Laws that require borrowers to obtain credit counseling before closing on their loans are assigned the highest number, which is 2 for this measure. Those laws that only recommend counseling or that only require that borrowers be given notice of the right to or the value of credit counseling receive a 1, whereas laws that neither recommend nor require counseling are assigned a 0. Some jurisdictions prohibit loan terms that require borrowers to submit any disputes arising from their loans to arbitration or that otherwise restrict borrowers' access to the courts. Using a scale of 0 to 2, laws that prohibit such terms are scored a 2. Laws with partial restrictions are scored 1. And, laws without any restrictions are assigned a score of 0.

The enforcement mechanisms component of the index contains two measures: assignee liability and enforcement against originators. The former measures the potential liability that purchasers or other assignees of mortgages have for wrongdoing by originators. This measure is important because there has been concern that assignee liability provisions in state laws could impede the availability of credit or drive up the price of loans. Our assignee liability measure assigns a 0 to laws that do not contemplate assignee liability unless the assignee participated in the violation of the law. Laws that allow borrowers to raise defenses, including claims of recoupment, to foreclosure or collection actions brought by assignees receive a 1. Stronger laws that impose liability on assignees who fail to engage in due diligence designed to identify loans that contain predatory features are assigned a 2. Laws that allow for limited claims against assignees even if they engage in due diligence are scored a 3. This score also applies if assignees

are liable for willful violations by originators. The highest score is reserved for laws that impose liability on assignees without providing any due diligence safe harbors.

The final measure takes into account the variation in enforcement schemes and available remedies against originators. Laws that can only be enforced by state government, *i.e.*, that preclude private lawsuits, are given the lowest score. Those laws that allow private lawsuits for compensatory damages, but no punitive relief are scored a 1 and those that allow private lawsuits with punitive relief are assigned a 2.

2. Creating A State Level Law Index

The sum of the three components defines the full index. We begin creating the state level law index by determining the value that should be assigned to each subcomponent at the state level. This process is complicated by the fact that in 14 states, there are two or more laws applicable to subprime lending, and those laws may simultaneously impose different limitations. This paper does not attempt to control for each law separately in those states. Instead, the law providing the broadest coverage is used in creating the index. If more than one law provides similar coverage (*i.e.*, the coverage component value is identical or very similar), the highest value of each subcomponent is used to generate the index.³⁸

Similar to Ho and Pennington-Cross (2006b) each of the components is rescaled to insure that the indexes are not overly representative in terms of absolute value or variance of any single subcomponent. For illustration consider the law in Alabama and the coverage subcomponents (loan purpose, APR trigger 1st Lien, APR trigger higher liens, and points and fees trigger). First, each subcomponent is divided by the maximum possible value, so that values will range from 0 to 1. Alabama's score for loan purpose was a 2, while the maximum allowable loan purpose score is 4. Therefore, Alabama's re-scaled loan purpose value is 0.5. The same procedure is used for the remaining subcomponents (APR trigger 1st Lien = 1, APR trigger higher liens = 1, and points and fees trigger = 0.8). The sum of these values equals 3.3 for Alabama. This process is repeated for all laws. Alabama's coverage value is then divided by the average coverage value for all states (2.1954). As a result, Alabama's coverage index value is 1.5 ($1.5 \approx 3.3 / 2.1954$). This approach is applied to each of the subcomponents that make up the coverage, restrictions and enforcement mechanisms indexes. As a result the average value of each of the indexes is 1 and the average of the full index, which is the sum of the components, is 3.

Table D provides the index for each of the 40 states. Each of the components includes at least one state that has an index of 0, which indicates that those states have enacted very weak laws in some aspects. For example, Florida, Ohio, Oklahoma, and Pennsylvania all have 0 points in terms of coverage. In terms of restrictions, Nebraska and Nevada also have 0 points; and Louisiana, Minnesota, Rhode Island and Utah all have 0 points in terms of enforcement mechanisms. Pennsylvania's full index is 1.34 and is the lowest observed value. There is substantial variation in the laws across all components, but in general, it appears that laws with strong market coverage tend to have weaker restrictions and enforcement mechanisms (coverage, restrictions, and

enforcement mechanisms are all negatively correlated), and laws with stiff enforcement tend to be more restrictive (restrictions and enforcement mechanisms are positively correlated).

B. Identification Strategy

The prior literature takes a variety of approaches in attempts to identify the impact of anti-predatory lending laws in the subprime market. Most of the literature includes whole states in the analysis and includes a dummy indicating that a law is in effect. This can be done in an event study framework or in a panel data set where the unit of observation is the loan, county, or state. However, by including all loans in the state this approach implicitly assumes that loans made on opposite ends of a state are similar and that all parts of the state are experiencing similar economic conditions. These assumptions are very unlikely to hold and are especially important when using data sets with missing information (Elliehausen and Staten, 2004 & 2006; Harvey and Nigro, 2003 & 2004; Li and Ernst, 2006).

We use an approach similar to Holmes (1998). Holmes examined the impact of right-to-work laws on employment at state borders. This geographic sampling approach helped to identify the impact of the policy by limiting employment data to those who are employed near to each other and, as a result, are in more similar labor markets. The approach taken in this paper is to take advantage of the non-economic nature of state boundaries by examining loans along state borders. Loans are included in the sample if they originate in a county that is geographically along a state border, if at least one of the two border states (the county's state and the neighboring state) has an anti-predatory lending law. However, if the status of anti-predatory lending laws in either state changes during the calendar year (*e.g.*, new laws become effective or old ones are amended), the loans are excluded from the sample.³⁹

Table E describes the geographic distribution of loan originations along state borders. Each of these border pairs will effectively define a region through fixed effects (dummy variables). Any remaining differences will be associated with control variables describing the borrower or applicant and the location of the property at the county and tract level. This approach is best described as a differences-in-differences identification approach which is augmented through a geographic-based sampling approach.

The base model can thus be specified as:

$$(1) \text{ Outcome}_{it} = \beta^0 + \beta^1 \text{ Law}_i + \sum_{j=ALFL}^{\text{VAWV}} \beta_j^2 \text{ Border}_{ji} + \beta^3 \text{ Borrower}_i + \beta^4 \text{ Location}_i + \varepsilon_i$$

where *i* and *j* index respectively the individual loans and the state border pair, *Law* indicates whether the state where the loan originates has an anti-predatory lending law or laws and the strength of the law(s) across various dimensions, *Border* indicates that loans are in border counties for the indicated pair of states (North Carolina and Virginia, NCVA, being the excluded state border pair), *Borrower* represents borrower

characteristics, *Location* represents location specific characteristics, and ε represents an identically and independently distributed random error term. Because the outcomes are binary, we estimate all relationships using the logit specification.⁴⁰

In the base model the vector *Law* only includes the variable *Ineffect* which indicates that the loan is in a state where an anti-predatory lending law is effective. Ho & Pennington-Cross (2006b) and Li and Ernst (2006) show that such laws can have either positive or negative impacts on the volume of subprime lending but tend to depress rejection rates on average. Therefore, the sign of the coefficient on *Ineffect* is largely indeterminate. In alternative model specifications, *Law* will include (1) the full index or (2) the coverage, restrictions, and enforcement mechanisms indexes. It is expected that the full index will have little impact on the subprime mortgage market, because restrictions may depress the market by limiting the availability of some loan types, while coverage may stimulate demand in the market by making potential customers less fearful of predation. There is no prior evidence on the impact of enforcement mechanisms on the subprime mortgage market, but they may stimulate the market if potential customers are convinced that the law will eliminate any predation or depress the market if compliance is difficult or expensive.

Since the border dummies control for the economic conditions along the border of geographically contiguous states, the sign of the coefficients could be positive or negative depending on local economic conditions.

Similar to the prior literature (Elliehausen and Staten, 2004 & 2006; Harvey and Nigro, 2003 & 2004; Li and Ernst, 2006; Ho & Pennington-Cross, 2006a & 2006b), we include control variables for Borrower and Location. **Table F** includes variable descriptions and the source for each variable. We expect that borrowers will be more likely to use subprime loans in locations with depressed economic conditions, in areas with a high percentage of minority households, and when applicants have low income or are requesting large loan amounts relative to income (Calem, Gillen, and Wachter, 2004; Pennington-Cross, 2002). The county housing vacancy rate, unemployment rate, and population growth over the prior year are included as proxies for location characteristics. Borrower income, the loan-to-income ratio, and the census tract's minority percentage are also included as proxies for borrower traits. Unfortunately borrower credit score is unavailable despite the fact that it is an important factor in underwriting both prime and subprime loans.

Table G provides summary statistics for the estimation data set. For each of the potential outcomes 225,000 loans are randomly sampled from the appropriate border counties for estimation to reduce estimation time. The 2004 data indicate that 16 to 18 percent of loan originations are classified as subprime, 33 percent of applications are subprime, and 44 percent of subprime applications are rejected. In addition, subprime borrowers tend to have substantially lower incomes, request higher loan-to-income ratios, and live in locations with more minorities, higher vacancy rates, higher unemployment rates, and lower density. The 2005 data show a substantially higher fraction of subprime loans than in 2004 (27 percent versus 16 percent). There are many small changes in the magnitude of all variables when comparing 2004 to 2005, but the summary statistics are

very similar and these differences can reflect changes in the economic environment as well as the different composition of the sample.⁴¹

The last variable included is an indicator that the lender was regulated by the O.C.C. The O.C.C. is the regulator of national banks and has exempted national banks from state and local anti-predatory lending laws. Therefore, law impacts may differ for national banks, as identified by the O.C.C. dummy variable.

C. Logit Results

Tables H and I provide the coefficient estimates, the standard error, and the odds ratio for the location and borrower controls and the *Ineffect* dummy variable. **Table H** provides results for the origination outcome and **Table I** provides results for the application and rejection outcomes.

Law Variables -- The impact of the average law can be seen in **Tables H and I** by examining the coefficient and associated odds ratio for the *Ineffect* variable. The typical law appears to increase the odds of applying for and using a subprime loan by 5 to 10 percent. However, there seems to be no impact on the probability of being rejected. **Table J** reports results from two separate specifications. In one specification only the full index is added to the base model. In the other specification, the restrictions, coverage and enforcement mechanisms indexes are all included in the specification. Overall the results are very similar to those found in Ho and Pennington-Cross (2006b). In particular, laws with greater coverage tend to be associated with more subprime applications and originations, while laws with stronger restrictions tend to reduce applications and originations.

The results indicate that stronger laws, as proxied by the full index, tend to be associated with an increase in the odds of originating a subprime loan by 3 percent. The results are consistent for 2004 and 2005, as well as when the APR spread or price of the mortgage is used to identify a loan as subprime. However, the result is statistically insignificant when the dependent variable is designed using the HUD subprime lender list. The full index has no measurable impact on applications but is associated with a reduction of 3 percent in the odds of having a subprime application rejected.

Of course, the full index is a blunt measure. Two anti-predatory lending laws can have the same full index but actually be very different, depending on the relative strength of provisions measured by each of the three index components. These variations can result in substantially different market responses. As a result, we can gain more meaningful insights by analyzing the effect of each component of the full index. For instance, a 0.5 increase in the coverage index (the mean coverage index value is 1) is associated with a 4 to 5 percent increase in the odds of originating a subprime loan and a 2 percent increase in the odds of applying for a subprime loan.⁴² By contrast, a 0.5 unit increase in the restrictions index (the mean restrictions index value is 1) is associated with a 1 to 4 percent decrease in the odds of originating a subprime loan and a 4 percent decrease in the odds of applying for a subprime loan.

In terms of the probability of being rejected on a subprime application, a 0.5 increase in the coverage index is associated with a 2 percent reduction in the odds of being rejected. However, the restrictions index had no measurable impact on rejections.

The enforcement mechanisms index seems to impact the subprime market in a similar fashion as the coverage index. For example, stronger enforcement mechanisms tend to increase originations and applications and depress rejections. One way to interpret these results is that a law makes borrowers more comfortable applying for subprime loans if the law is likely to cover their applications and lenders face substantial enforcement costs for violating the law. As a result, a properly designed anti-predatory lending law may actually lead to a larger subprime mortgage market when penalties for violating the law have some real "teeth."

Control Variables -- The results for the probability of origination are very consistent across different years and variable definitions of what is subprime. For example, the odds ratio for *income* range from 0.92 to 0.95 and the coefficient estimate is significant in all three regressions. Similarly consistent results are found for the *minority*, *unemployment*, and *OCC* variables. In addition, the *loan2income* variable always reduces the odds of originating a subprime loan, and more densely populated areas are always associated with a lower probability of originating a subprime loan. Put simply, a subprime origination is most likely in locations with high percentages of minority residents and people on low incomes, and with high rates of unemployment in both 2004 and 2005.

In terms of applications, borrowers in locations with a concentration of minority households tend to apply much more often (odds ratio = 1.14) as well as households with lower incomes (odds ratio = 0.95) and higher unemployment rates (odds ratio = 1.05). The probability of being rejected on a subprime application also meets expectations. For example, lower incomes, higher vacancy rates, higher unemployment rates, and living in a predominantly minority area all increase the odds of having a subprime application rejected.

V. Conclusion

The current research builds upon prior research examining the effects of anti-predatory lending laws on subprime lending markets. It uses a new, improved data set that better describes the legal landscape regarding predatory lending. This new data permit a broader coverage of states and the evaluation of the effects of remedies against originator and assignee liability.

The results are consistent with the view that anti-predatory lending laws have not harmed subprime lending markets and indeed may have enhanced the functioning of the market. The data show that applications for and originations of subprime lending are higher and denial rates are lower in states that have stronger anti-predatory lending laws. Such a pattern suggests that the presence of these laws induces some borrowers to apply for subprime mortgages, who otherwise would be unwilling to borrow money for fear of

being taken advantage of by a predatory lender. Moreover, that originations rise and denials fall suggests that these additional borrowers are quality credits and is consistent with the view that predatory lending has adversely affected access to credit for marginal borrowers who would be served by the subprime lending market.

Provisions of anti-predatory lending laws also seem to matter. The observed overall patterns (higher applications and originations, lower denial rates) are stronger in locales whose laws have wider coverage, greater restrictiveness, and stronger enforcement mechanisms.

Table A: The North Carolina Anti-Predatory Lending Law

Stage 1 (effective date October 1, 1999)

These provisions apply to certain closed-end, owner-occupied residential mortgages without regard to APRs or points and fees.

- Bans the following activities
 - Balloon payments in home loans (defined as closed-end, first-lien loans of under \$300,000) with terms of over six months
 - Prepayment penalties and cap fees in home loans for personal use of under \$150,000
 - Payoff fees in loans under \$300,000
- Proscribes encouraging consumer home loan borrowers to default
- Prohibits loan flipping (defined as refinancings of consumer home loans without a reasonable, tangible net benefit to the borrowers).

Stage 2 (effective date July 1, 2000)

Most of these provisions apply to high-cost home loans,⁴³ defined as closed-end, owner-occupied loans (other than reverse mortgages) for personal use under Fannie Mae's conforming loan size or \$300,000 that exceed either one of the following thresholds:⁴⁴

- (a) where the APR at consummation exceeds the yield on Treasury securities of comparable maturity plus eight percent (ten percent) for first-lien loans (subordinate-lien loans) ; or
- (b) where total points and fees exceed 5 percent of the total loan amount for loans of \$20,000 or more, or the lesser of \$1000 or 8 percent of the total loan amount for loans under \$20,000.⁴⁵

- Regulates the following provisions
 - Acceleration clauses
 - Balloon payments
 - Negative amortization
 - Interest rates upon default
 - Advance payments
 - Modification and deferral fees
 - Loans without regard to ability to repay
 - Financing of fees
 - Loan flipping
 - Payments to home contractors from loan proceeds
- Requires loan applicants to obtain advance loan counseling from a certified counselor in order to close on a high-cost loan.

Table C: Coding rules for scoring state-level anti-predatory lending laws⁴⁷

<i>Coverage dimensions</i>	
Loan type ⁴⁸	<p>0 = HOEPA equivalent (excludes home purchase, reverse mortgages, open-ended loans)</p> <p>1 = law does not cover government loans</p> <p>2 = law does not cover reverse and/or open-ended loans</p> <p>3 = law does not cover business and/or construction loans</p> <p>4 = law covers all loans</p>
APR trigger for first lien mortgages	<p>0 = HOEPA equivalent (8% plus comparable Treasury security yield)</p> <p>1 = 7-8 % plus the comparable Treasury security yield</p> <p>2 = 6-7 % plus the comparable Treasury security yield</p> <p>3 = no APR trigger</p>
APR trigger for subordinate mortgages	<p>0 = HOEPA equivalent (10% plus comparable Treasury security yield)</p> <p>1 = 9-10% plus comparable Treasury security yield</p> <p>2 = 8-9% plus comparable Treasury security yield</p> <p>3 = 6-8% plus comparable Treasury security yield</p> <p>4 = no APR trigger</p>
Points and fees trigger: ⁴⁹	<p>0 = HOEPA equivalent (8% of loan amount or \$400)</p> <p>1 = 6-8 % of the total loan amount⁵⁰</p> <p>2 = 5-6 % of the total loan amount</p> <p>3 = less than 5 % of the total loan amount</p> <p>4 = no points and fees trigger</p>
<i>Restrictions dimensions</i>	
Prepayment penalties ⁵¹	<p>0 = no prepayment penalty restrictions</p> <p>1 = bans all penalties 60-84 months after origination</p> <p>2 = bans all penalties 36-42 months after origination</p> <p>3 = bans all penalties 24 months after origination</p> <p>4 = bans all prepayment penalties</p>
Balloon payments ⁵²	<p>0 = no restriction</p> <p>1 = no balloons allowed in first 7 years of loan</p> <p>2 = no balloons allowed in first 10 years of loan</p> <p>3 = no balloons allowed after 10 or more years of loan</p> <p>4 = no balloons allowed</p>
Credit counseling requirements ⁵³	<p>0 = credit counseling not required</p> <p>1 = credit counseling recommended or lender must give borrowers notice of right to/value of credit counseling</p> <p>2 = credit counseling is required</p>
Limits on judicial relief/mandatory arbitration ⁵⁴	<p>0 = does not prohibit restrictions on judicial relief⁵⁵ and mandatory arbitration</p> <p>1 = limits⁵⁶ restrictions on judicial relief and mandatory arbitration</p> <p>2 = prohibits mandatory arbitration and other restrictions on judicial relief</p>
<i>Enforcement mechanisms</i>	
Assignee liability ⁵⁷	<p>0 = no assignee liability for holders in due course</p>

	<p>1 = borrowers can only seek relief against assignees as defenses, including claims of recoupment, to assignee foreclosure and/ or collection actions</p> <p>2 = Hold liable only those assignees who do not exercise due diligence</p> <p>3 = even if assignees exercised due diligence, they may be subject to limited claims and defenses or assignees are liable for willful violations by originators regardless of any due diligence</p> <p>4 = assignees are liable even if they exercise due diligence</p>
<p>Enforcement against originators⁵⁸</p>	<p>0 = only the state government can enforce anti-predatory lending laws</p> <p>1 = borrowers have a private right of action and can recover compensatory, but no punitive damages, statutory damages that are non-compensatory,⁵⁹ or civil penalties</p> <p>2 = borrowers can bring private lawsuits and recover compensatory damages, and punitive damages, statutory non-compensatory damages or civil penalties</p>

Table D: Law Index

State	Coverage	Restrictions	Enforcement	Full Index
Alabama	1.50	1.50	0.40	3.40
Alaska	1.39	0.75	1.61	3.74
Arkansas	0.30	1.87	1.41	3.57
California	0.55	0.93	0.80	2.29
Colorado	1.73	0.75	1.21	3.68
Connecticut	1.62	0.37	0.00	1.99
DC	0.94	1.31	1.21	3.46
Florida	0.00	1.12	0.40	1.52
Georgia	0.41	2.06	1.21	3.67
Hawaii	0.71	0.19	1.21	2.10
Idaho	1.62	0.37	1.61	3.60
Illinois	0.94	1.31	1.41	3.66
Indiana	1.73	0.37	1.21	3.31
Iowa	1.73	0.75	0.40	2.88
Kansas	1.73	0.75	1.61	4.09
Kentucky	1.39	0.19	1.21	2.78
Louisiana	1.62	0.19	0.00	1.80
Maine	1.39	0.19	1.21	2.78
Maryland	1.50	1.50	1.61	4.61
Massachusetts	0.52	2.62	1.41	4.55
Michigan	1.39	0.93	0.60	2.93
Minnesota	1.71	0.37	0.00	2.08
Mississippi	1.73	0.19	1.21	3.12
Missouri	1.62	0.19	1.21	3.01
Nebraska	1.73	0.00	0.40	2.13
Nevada	0.00	0.00	1.61	1.61
New Jersey	0.50	1.87	1.41	3.78
New Mexico	0.68	2.24	1.41	4.33
New York	0.52	1.31	1.01	2.84

*, **, *** indicate that the loans are excluded from the 2004, 2005, or both samples. This is either due to a law becoming in effect during the year, insufficient sample size (less than 0.001 percent of sample), or no law in effect.

Table F: Variable Definitions

Variable	Definition	Source
<i>Outcome Variables</i>		
Origination (price ID)	Indicator variable = 1 for subprime origination; 0 for prime origination; Subprime loans identified by reported APR spread	HMDA
Origination (list ID)	Indicator variable = 1 for subprime application; 0 for prime application; Subprime loans identified by HUD subprime lender list	HMDA & HUD
Application	Indicator variable = 1 for subprime application; 0 for prime application; Subprime loans identified by HUD subprime lender list	HMDA & HUD
Rejection	Indicator variable = 1 for rejected subprime application; 0 for accepted subprime application; Subprime loans identified by HUD subprime lender list	HMDA & HUD
<i>Control Variables</i>		
Income (thousands \$)	Borrower's gross annual income (in thousands \$)	HMDA
Loan2inc	Ratio of requested loan amount to borrower's income	HMDA
Minority	Tract's minority population percentage	HMDA
Population	County's percentage growth over the prior calendar year	Census Bureau
Vacant	County's percentage of vacant housing units	Census Bureau
Unemployment	County's unemployment rate	Bureau of Labor and Statistics
Density	Census tract population density (100's per square mile)	Census Bureau
OCC	Lending institution regulated by the Office of Currency Comptroller	HMDA

During estimation income is expressed in millions, all percentages are expressed as fractions.

Table G: Descriptive Statistics

* Significance at 5% level. ** Significance at the 1% level.

The unit of change when evaluating the odds ratio is one.

The Full Index coefficient estimates are estimated separately from the Restrictions, Coverage, and Enforcement coefficient estimates.

¹ The subprime market is designed for borrowers with unconventional or blemished credit histories and charges higher interest rates and fees.

² In 1998, subprime mortgages comprised 2.4% of outstanding home mortgage loans; by the second quarter of 2006, they made up 13.4%. Duncan (2006).

³ While predatory lending is hard to define with precision, it generally either involves excessive prices in view of the borrowers' risk or lending without regard to borrowers' ability to repay. Engel and McCoy (2006) define predatory lending as a syndrome of loan terms or practices involving one or more of the following features: (1) loans structured to result in seriously disproportionate net harm to borrowers; (2) rent-seeking; (3) illegal fraud or deception; (4) other information asymmetries favoring brokers or lenders; (5) mandatory arbitration clauses; (6) lending discrimination; and (7) servicing abuses.

⁴ Mortgage Bankers Association (2006).

⁵ Engel & McCoy (2007).

⁶ Azmy (2005).

⁷ For discussion of negative externalities from abusive mortgage lending, see, e.g., Apgar & Duda (2005), Engel (2006), and Quercia, Cowan & Moreno (2005).

⁸ Peterson (2004).

⁹ Eskridge (1984); Whitman (1993). Colorado, Idaho, Indiana, Iowa, Kansas, Maine, Oklahoma, South Carolina, Utah, Wisconsin, and Wyoming adopted the Uniform Consumer Credit Code. Legal Information Institute (2007). Not all states' versions of the U.C.C.C., however, regulate prepayment clauses or balloon clauses.

¹⁰ 15 U.S.C. § 1602(aa)(1)–(4); 12 C.F.R. § 226.32(a)(1), (b)(1). For 2007, the dollar trigger was raised to \$547. 71 Fed. Reg. 46388 (Aug. 14, 2006). HOEPA contains a complex system of exclusions from “total points and fees.” The exclusions include certain application fees, late charges, closing costs, security-interest charges, and filing and recording fees. National Consumer Law Center § 3.9 (1999).

¹¹ Federal Reserve System (2001), at 65,606–65,610.

¹² Loan flipping involves refinancing a residential mortgage with high fees in order to strip equity from a home, with little or no benefit to the borrower. When loan flipping occurs, often it is instigated by the original lender, mortgage broker, or one of their affiliates.

¹³ 12 C.F.R. §§ 226.32, 226.34. In general, holders of HOEPA loans “are subject to all claims and defenses . . . that could be raised against the original lender.” 15 U.S.C. § 1641(d)(1).

¹⁴ Demyanyk (2006) has surmised that states with comparatively high income inequality are more likely to pass mini-HOEPA statutes. According to her estimates, every 10 percent increase in income inequality in a state in the current period made it 8 percent more likely that a state would adopt a predatory lending law in the next period.

When legislative campaigns stalled at the state level, some cities and counties passed anti-predatory lending ordinances of their own. These include Atlanta, Chicago, Cleveland, Cleveland Heights, Cook County (IL), Dayton, DeKalb County (IL), Detroit, Los Angeles, New York City, Oakland, Philadelphia, Sacramento, and Toledo. All of these ordinances have been enjoined by court order, preempted by state legislation, or limited in coverage to lenders who contract with the cities. In most cases, these ordinances never took effect or if they did take effect, they did so only briefly.

¹⁵ Renuart & Keest (2005), §§ 3.10.1, 3.10.2 at n. 679; see *infra* note 22.

¹⁶ 12 C.F.R. § 560.2; Renuart & Keest (2005), § 3.5.3.

¹⁷ 69 Fed. Reg. 1904 (Jan. 13, 2004) (codified at 12 C.F.R. §§ 34.3, 34.4). In the years preceding this regulation, the O.C.C. issued several preemption rulings applying to discrete laws in individual states. In the most famous of these rulings, issued in 2003, the O.C.C. preempted the Georgia Fair Lending Act. Renuart & Keest (2005), § 3.4.6.1.

¹⁸ See, e.g., O.C.G.A. §7-6A-12; Johnson (1995).

¹⁹ *Watters v. Wachovia Bank, N.A.*, No. 05-1342 (U.S. S. Ct.).

²⁰ The article did not explain how subprime loans were defined. The American Financial Services Association represents large subprime lenders. At the time of the study, its members included Ameriquest Mortgage

Company, Conseco Financial Corporation, Countrywide Home Loans, Equity One, CitiFinancial, Household Finance Corporation, Key Consumer Real Estate, Washington Mutual Finance, and Wells Fargo Financial, Inc.

²¹ The study only compared subprime lending before and after the law's enactment date, rather than before enactment and after the full effective date. Although the authors conceded that that "window for detecting changes in lending patterns following passage of the North Carolina statute [was] narrow," they argued that "creditors would not wait for the law to be fully effective to adjust their operations" because some parts of the law (including the ban on prepayment penalties) became effective in part on October 1, 1999 and even those provisions that did not go into effect until June 1, 2000 were known by July 1999, when the law was passed. *Id.* at 422.

²² From 1982 through year-end 2003, South Carolina banned prepayment penalties in most personal mortgages of up to \$100,000. Former S.C. Code Ann. § 37-10-103 (2001). Another control state, Virginia, had a similar ban. Starting on January 1, 1998 and continuing today, Virginia limited the size of prepayment penalties in junior lien residential mortgages and banned them altogether in refinancings of those mortgages by the same lender or an assignee. Va. Stat. § 6.1-330.85 (2006). Meanwhile, Tennessee's usury law required disclosure of certain prepayment penalties in residential mortgages as of January 1, 2001. Tenn. Code Ann. § 47-14-108 (2006).

Until July 2003, the federal Alternative Mortgage Transaction Parity Act (AMTPA) preempted state restrictions on prepayment penalty and balloon clauses for mortgages other than fixed-rate, fully amortizing mortgages made by "state housing creditors" (*i.e.*, non-depository lenders). AMTPA preemption applied in all states except six states that timely opted out of AMTPA's coverage. Renuart & Keest (2005), §§ 3.10.1, 3.10.2. Of the control states, only South Carolina opted out of AMTPA and thus only South Carolina's prepayment penalty law was in effect during the period examined by the Elliehausen-Staten study. In contrast, North Carolina did not opt out of AMTPA and thus its prepayment penalty restrictions were subject to AMTPA preemption. In July 2003, the U.S. Office of Thrift Supervision (2003) issued a ruling reversing federal preemption of state prepayment penalty laws under AMTPA. The ruling thus revived state laws regulating prepayment penalties for non-depository finance companies.

²³ See note 22 *supra*. Among other things, AMTPA preempted state restrictions on prepayment penalties and balloon clauses. Renuart & Keest (2005), §§ 3.10.1, 3.10.2 at n. 679.

²⁴ For comment on this study, see Center for Responsible Lending (2004).

²⁵ Scheessele (1999); HUD Subprime and Manufactured Home Lender List (2007).

²⁶ Defined as a prepayment penalty of more than three years, a balloon payment, and/or a combined loan-to-value ratio of 100 percent or more. For debate of an earlier draft of this study, see U.S. Office of the Comptroller of the Currency (2003), Litan (2003) and Stegman, Quercia & Davis (2003).

²⁷ Quercia, Stegman & Davis (2004) at 596.

²⁸ The Philadelphia ordinance took effect on April 19, 2001. Philadelphia Municipal Ordinance 00-715A (2000). The Pennsylvania legislature preempted the city ordinance effective June 25, 2001. 63 Pa. Stat. 456.504 The study mistakenly used October 1, 2001 through March 31, 2002 as the period in which the Philadelphia was in effect. By then, however, the law had already been overturned.

²⁹ Another report, by the Center for Statistical Research (2003), estimated that enactment of a law would cause subprime mortgage loans to decrease in New Jersey, based on data from North Carolina after passage of the North Carolina law. The study used rudimentary methodology and studied a time-period that ended twenty months before the New Jersey law was passed.

³⁰ Morgan Stanley (2002) at 11.

³¹ In Georgia (but not New Jersey), the reduction in overall subprime originations was attributable to a decline in loans with predatory features. Li & Ernst (2006) at 13-14. It is possible that the Georgia wild card statute (see note 18 *supra*) helps explain the Georgia results.

³² Compared with the control states, nominal interest rates rose an average of 15.4 basis points on fixed-rate 30-year subprime mortgages without prepayment penalties in Georgia and rose 17.3 basis points on average on adjustable-rate 2/28 hybrid mortgages without prepayment penalties in Virginia. *Id.* at 16-17.

³³ The sample included border counties in ten states with anti-predatory lending laws – California, Connecticut, Florida, Georgia, Maryland, Massachusetts, North Carolina, Ohio, Pennsylvania, and Texas – and border counties in adjacent, unregulated states as controls. Ho & Pennington-Cross (2006b) at 218.

³⁴ After doing our own legal research, we recalculated the 22 individual state rankings based on the coverage and restrictions indexes in this paper. Colorado, Georgia, Illinois, Massachusetts, North Carolina, New Jersey, New Mexico, New York, South Carolina, and Utah had the strongest combined rankings for coverage plus restrictions of the 22 states.

³⁵ Prior research has typically relied on summaries of state and local anti-predatory lending laws compiled by law firms and trade associations.

³⁶ Standard & Poor's (2005).

³⁷ As of January 5th, 2007 the list is only available for 2004 HMDA. This list is a lender list so loans identified as subprime are likely to also include some prime loans and loans identified as prime are likely to include some subprime loans.

³⁸ The number indicates which law is used as coded on the law table in the prior section, and max indicates that the maximum across the laws indicated is used -- Colorado (1), Connecticut (2), Indiana (1), Kansas (1), Kentucky (2), Maine (2), Maryland (3&4, max), Michigan (1&2, max), Mississippi (1&2, max), New Jersey (1&2, same), Oklahoma (2), Rhode Island (1), South Carolina (2), Utah (1).

³⁹ This is done because HMDA reports data annually with no other more detailed date information. As a result, the 2004 sample will only include loans that were in effect before January 2004 and the 2005 sample will only include laws that were in effect before January of 2005.

⁴⁰ The logit specification is given by $\Pr(Y = 1) = e^{x_i\beta} / (1 + e^{x_i\beta})$, where Y is the outcome (application, origination, or rejection), x is a vector of explanatory variables as defined in the specification, β is a vector of parameters to be estimated.

⁴¹ The following state pair borders are excluded from the 2004 (AZUT, CONM, COUT, CONE, GANC, IAWI, IAMO, IDNV, IDUT, ILWI, ILKY, KSNE, KYMO, KYVA, MARI, MANH, MAVT, MONE, MOTN, MTWY, MTND, NDSO, NMTX, NVUT, UTWY) and 2005 (MANH, MENH, MIWI, MNWI, NHVT) samples either due to too few loans on the border or a law coming into effect during the year.

⁴² A 0.5 unit is chosen for the odds ratios for the component indexes while a 1 unit odds ratio is chosen for the full index to make the odds ratios more comparable across indexes. This is because the mean value for the full index is 3, while the mean value for the component indexes is 1.

⁴³ In addition, the North Carolina provisions banning the financing of single payment credit insurance in consumer home loans did not go into effect until July 1, 2000.

⁴⁴ 1999 N.C. Sess. Laws 332 (1999), codified at N.C. Gen. Stat. 24-1.1A, 24-1.1E, 24-2.5, 24-8, 24-10.2.

⁴⁵ For purposes of this trigger, the North Carolina law expanded the definition of “points and fees” beyond the meaning in HOEPA to include other mortgage broker compensation and many large prepayment penalties. N.C. Gen. Stat. § 24-1.1E(6).

⁴⁶ Ohio Revised Code § 1349.25 (to take effect on January 1, 2007). In late 2006, before the effective date of the new Ohio law, the state legislature amended these new anti-predatory lending provisions to curtail the strength of the law. The outgoing governor neither signed nor vetoed the amendments. In January 2007, the newly-elected governor vetoed the amendments. There is uncertainty whether the veto will be deemed effective, placing the status of the new Ohio mini-HOEPA law into doubt.

⁴⁷ The index includes only laws that were in effect by January 1, 2005.

⁴⁸ In coding laws along this measure, we code for the most conservative assessment of coverage. For example, a law that excludes coverage for business loans and open-ended loans is coded 2. Laws that exclude consumer credit transactions or loans for personal use are coded as excluding business loans.

⁴⁹ If a law's points and fees triggers varied based on the amount of the loan, we scored the law based on the triggers that applied to the largest loan amount.

⁵⁰ If the law extends HOEPA in other ways without changing the trigger and the trigger is not 6 percent or lower of the total loan amount, the score equals 1.

⁵¹ Laws that permit reasonable and necessary prepayment penalties are coded as 0. If a law uses prepayment penalties to determine coverage triggers, but does not ban prepayment penalties, it is assigned a 0.

⁵² Laws that prohibit balloon payments larger than twice the monthly payment without any restrictions in time were scored as a 4.

⁵³ If counseling is required for some but not all types of loans, the score is 2. Similarly, if counseling was recommended for any type of loan the score is a 1.

⁵⁴ Laws that ban unconscionable arbitration terms receive a score of 1.

⁵⁵ Restrictions on judicial relief include provisions requiring borrowers to resolve disputes in a less convenient, more expensive forum than the one in which the borrower otherwise could have brought the claim.

⁵⁶ For example, a law may prohibit mandatory arbitration clauses that do not require the lenders to pay half the filing fee or do not obligate the lender to pay its own and the borrowers' arbitration fees for the first day of arbitration.

⁵⁷ If borrowers can obtain rescission against assignees, the measure is assigned a 4. If the law precludes assignee liability unless the violation is apparent on the face of the loan documents, the score is 0. However, for any law for which all violations would be apparent on the face of the loan documents, assignees could not be deemed holders in due course and, therefore, such laws are assigned a 4.

⁵⁸ If the law provides that violations of the anti-predatory lending law would give rise to claims under the state unfair and deceptive trade practices (UDAP) laws, the relief is coded according to the UDAP law. If the only remedy available is refund of an unlawful prepayment penalty, this measure is coded as a 1.

⁵⁹ This includes laws that permit borrowers to recover an amount equal to a set multiplier times actual damages.
